Subject Index

A

Abstraction, information-hiding metric and, 26:211
Ada symbolic debugger, reliability and, 26:69
ADARTS and CODARTS design methods, 25:127
Algebraic term nets (ATNets), reusing, 27:119
Algorithms
  APPROXIMATE, 27:243
  checkpointing algorithms in distributed systems, 25:59
  distributed multicasing algorithm with congestion control and message routing, 24:49
  k mutual exclusions in distributed systems, 26:179
  load-building algorithm for parallel compilation of files in software application, 26:167
  OCCAM programs from distributed parallel, 26:257
  real-time signal-processing, 25:73
  rollback-recovery algorithms in distributed systems, 25:59
Alvey program, software engineering research and development, 24:67
Ami approach, decision making for software process improvement, 26:43
Annual Oregon Workshop on Software Metrics (AOWSM), 24:209
AOWSM. *See* Annual Oregon Workshop on Software Metrics (AOWSM)
Application of Metrics in Industry. *See* **Ami** approach; ESPRIT II project 5494 **ami**
Application-specific interactive system, development of, 25:201
APPROXIMATE, query processing with, 27:243
AQuIS conferences, software quality and, 26:1
Artificial intelligence-based approach for reuse, 27:207
ATNets. *See* Algebraic term nets (ATNets)
Authors, assessment of software engineering, 27:63

B

β-Distributed stochastic petri net, software project time/cost management and, 26:149
Blocking mechanism, simulation study of multiprocessor system performance, 26:285
Born, multiple stack systems concepts, 27:45
Bug localization, declarative and operational models for automated, 25:223

C

CE. *See* Spreadsheet Calculator (CE) program
Checkpointing algorithms, in distributed systems, 25:59
Circular multiple stack systems, 27:45
Classification-based reuse, 27:207
Client-server architecture, context interchange in, 27:223
Clock drift, 27:73
Colored Petri nets, modeling concurrent programs with, 26:129
Combinators, for efficient list manipulation, 27:137
Compilation of files, parallel, 26:167
Complexity, information-hiding metric and, 26:211
Concurrent software process language (CSPL), 27:17
Concurrent software systems, parallel finite automata for modeling, 27:27
Constraint maintenance, data base, 27:171
Context interchange, in client-server architecture, 27:223
Creativity, discipline and, 26:195
Critical system functions, software verification in, 26:103
CSPL. *See* Concurrent software process language (CSPL)
Customer responsibility for ensuring usability, 25:241
Cyclomatic complexity, critique of, 26:197

D

Data bases
  coherent architecture for temporal object, 27:195
  constraint maintenance, 27:171
  context interchange in client-server architecture, 27:223
  entity-relationship model based on data flow diagram, 24:139
  historical and current data storage, 27:159
  object-oriented data base based on graphs, 24:155
  object-oriented data base system, transaction management in, 24:115
  object retrieval language (ORL), 24:187
  practical general-purpose relational data base management systems, 27:195
  query processing in parallel, 27:233
  query processing with APPROXIMATE, 27:243
  storage organization for temporal, 27:159
  user interface management approach for object-oriented, 27:183
Data flow diagram, object-oriented method in entity-relationship model from, 24:139
Deadlock
  distributed real-time nested transactions and, 27:85
  self-scheduling orders and, 26:245
Debugging
  declarative and operational models for automated, 25:223
  generalized algorithm debugging technique (GADT), 25:223
  reliability in, 26:69
Decomposition/generalization methodology, for object-oriented programming, 24:181
Dependability, structure-oriented dependability evaluation of fault-tolerant protocols, 25:85
Discipline, creativity and, 26:195
Distributed real-time nested transactions, 27:85
Distributed spreadsheet computing, very fast, 25:185
Distributed systems
  checkpointing and rollback-recovery algorithms in, 25:59
  integrated modeling of object-oriented, 26:233
  k mutual exclusions in, 26:179
  recovery procedure for fault tolerance in, 25:39
Distribution information systems, rapid prototyping tools for, 24:3
DOSL. *See* Distributed object-oriented specification language (DOSL)

E

ECE. *See* Equivalent C expressions (ECE)
Education, assessment of software engineering, 27:63
Entity analysis, data flow analysis and, 24:139
Entity/class relationship, in integrated object-oriented analysis and design method, 24:31
Equivalent C expressions (ECE), Spreadsheet Calculator (CE) program and, 25:185
ESPRIT II project 5494 **ami**, 26:43
External risk assessment, measuring software failure risk, 25:257

F

Failure, measuring software failure risk, 25:257
Fault generation model, 26:31

Fault location, in real-time control systems, 25:1
Fault pattern, software and hardware fault tolerance, 26:117
Fault tolerance
design and analysis, 25:101
in distributed systems, 25:39
real-time systems and, 25:1, 25:2, 25:23
reliability evaluation of fly-by-wire computer systems, 25:108
replica of data for, 27:73
software and hardware, 26:117
structure-oriented dependability evaluation of, 25:85
synthesis of microarchitectures, 25:73
Faults, detection of safety-critical, 26:103
Flow control procedures, multistage packet-switched interconnection networks and, 273
Flow metric of Henry and Kafura, critique of, 26:197
Fly-by-wire computer systems, reliability evaluation of, 25:109
Formal methods, 27:71, 27:154
Fourth-generation language system, for software development, 25:193
Full system development, object-oriented approach in, 24:95
Function point metrics, 25:171
Fuzzy time Petri nets, timing constraints in complex software systems and, 25:23

G

G-Net systems, timing constraints in complex software systems and, 25:23
GADT. *See* Generalized algorithm debugging technique (GADT)
Generalized algorithm debugging technique (GADT), 25:223
Global consistency, in distributed systems, 25:59
Graphs, directed acyclic, object-oriented data base based on, 24:155
Group support systems, evaluation of management information systems, 24:267

H

Hardware fault tolerance, uniform approach to software and, 26:117
Historical and current data storage, 27:159

I

Imprecise computation, 27:73
Inclusion-preserving paging policies, 27:147
Inference design, fault location in real-time control systems, 25:3
Information and knowledge management, conference on, 27:157
Information exchange, context interchange in client-server architecture, 27:223
Information systems
group support systems in evaluation of, 24:267
object-oriented case-supported development of, 24:95
Institutions, assessment of software engineering, 27:63
Integrity control, maintenance of static integrity constraints in data bases, 27:171
Interactive systems, customer responsibility for ensuring usability, 25:241

J

Jackson Structured Programming method, object-oriented method integrating, 24:125

K

k Mutual exclusions in distributed systems, algorithm for, 26:179

L

Language system, software development and fourth-generation, 25:193
Large-scale real-time systems, design methods for, 25:127
Leading object, object-oriented design method integrating
Jackson Structured Programming method, 24:125
List manipulation, combinators for efficient, 27:137

M

Majority systems, *N*-version software system, 27:55
Management information systems, group support systems in evaluation of, 24:267
Management practice, software production and maintenance and, 26:5
Mental stress effect analysis, fault generation model and, 26:31
Message routing, multicasing algorithm for, 24:49
Metric, relative complexity, 24:211
Metrics
ami approach, 26:43
Annual Oregon Workshop on Software Metrics (AOWSM), 24:209
critique of, 26:197
decision making for software process improvement, 26:43
function point, 25:171
information-hiding, 26:211
for microcode of computer systems, 26:221
model-based framework for integration of, 26:77
object-oriented, 26:87
predicting software maintainability, 24:223
real-time, 24:223
relative complexity, 24:211
software production in European community and, 26:5
software production in Japan and, 26:5
theory and practice, 25:219
Microarchitectures, synthesis of fault-tolerant and real-time, 25:73
Microcode of computer systems, metrics for, 26:221
Modeling concurrency, colored Petri nets in, 26:129
Module loss analysis, measuring software failure risk, 25:257
Multicasing algorithm, with congestion control and message routing, 24:49
Multipath principle, fault-tolerance configurations based on, 25:101
Multiple stack systems, born and reborn, 27:45
Multiprocessor system performance, simulation study of, 26:285
Multistage packet-switched interconnection networks, unbalanced traffic loads in, 273
Mutual exclusions in distributed systems, algorithm for, 26:179
MYTHSEEKER project and computer system, 25:271

N

N-Version software systems, optimization of, 27:55
Nested loop in parallel, self-scheduling orders and, 26:245
Nested transactions, distributed real-time, 27:85

O

Object-orientation, theory and practice in, 24:91
Object-oriented analysis method, integrated object-oriented design and, 24:31
Object-oriented data bases
graphs and, 24:155
transaction management in, 24:115
user interface management for, 27:183
Object-oriented design method
integrating Jackson Structured Programming method, 24:125
integrating object-oriented analysis, 24:31
Object-oriented method
entity-relationship model based on data flow diagram, 24:139
full system development with, 24:95
Object-oriented metrics, 26:87
Object-oriented programming, decomposition/generalization methodology for, 24:181
Object-oriented systems, integrated modeling of distributed, 26:233
Object retrieval language (ORL), design and translation of, 24:187
OCCAM programs, distributed parallel algorithm from, 26:257
ODC. *See* Orthogonal defect classification (ODC)
Optimization, *N*-version software systems, 27:55

Organizational theory and behavior
role of professionals in small Italian software firms, 26:19
software production and maintenance, 26:19
ORL. *See* Object retrieval language (ORL)
Orthogonal defect classification (ODC), software process improvement methodology and, 26:61

P
Paging policies, inclusion-preserving, 27:147
Parallel finite automata, for modeling concurrent software systems, 27:27
Petri net models, parallel finite automata and, 27:27
Polynomials, predicting software maintainability, 24:223
Practitioner, software reuse and SoftClass versus, 25:147
Prepaging policies, analysis and development of, 27:147
Probabilistic comparison-based model, fault location and, 25:1
Process-centered software engineering environments, state of the art and open issues in, 26:53
Program complexity metrics, 24:211
Program-merging system for evolution of software versions, 27:129
Programming
object-oriented, decomposition/generalization methodology for, 24:181
OCCAM programs from distributed parallel algorithms, 26:257
theory and practice, 25:219
Programming languages, functional, list manipulation in, 27:137
Protocol specification, reusing algebraic term nets (ATNets) in, 27:119
Prototyping system, distributed program development with rapid, 24:3

Q
Query processing
APPROXIMATE, 27:243
dynamic, 27:233

R
Reactive systems, timing specification and validation of, 25:51
Real-time control systems, fault location in, 25:1
Real-time microarchitectures, synthesis of, 25:73
Real-time nested transactions, distributed, 27:85
Real-time signal-processing algorithms, microarchitectural implementations of, 25:73
Real-time software metrics, 24:223
Real-time systems
development of imprecise, 27:73
fault tolerance in, 25:1, 25:2, 25:23
recovery procedure for fault tolerance in distrbuted, 25:39
structure-oriented dependability evaluation of fault-tolerant protocols, 25:85
validation of formal requirement specifications of, 27:97
Reborn, multiple stack systems concepts, 27:45
Recovery block, software and hardware fault tolerance, 26:117
Recovery procedure, fault tolerance in distributed systems and efficient, 25:39
Relationship definition and management, requirement analysis tools in, 24:277
Remote procedure call-based programs, rapid prototyping system in development of, 24:3
Request for Proposal, customer responsibility for ensuring usability and, 25:241
Requirements definition process, 24:277
Reuse system, artificial intelligence-based approach for, 27:207
Robust regression for software estimation models, least-squares of inverted balance relative errors, 27:3
Rollback-recovery algorithms, in distributed systems, 25:59

S
Scheduling orders, guidelines for choosing multiprocessor, 26:245
Scholars, assessment of software engineering, 27:63
Self-scheduling orders, guidelines for choosing multiprocessor, 26:245
Simulation study, multiprocessor system performance, 26:285
SoftClass, software reuse and Practitioner versus, 25:147
Software design
ADARTS and CODARTS design methods, 25:127
discipline and creativity in, 26:195
fault-tolerance configurations based on a multipath principle, 25:101
large-scale real-time systems, 25:127
object-oriented method integrating Jackson Structured Programming method, 24:125
theory and practice, 25:219
top-down, "fake", 26:101
Software development
application-specific interactive system based on spreadsheet package, 25:201
β-Distributed stochastic petri net model, 26:149
concurrent software process language (CSPL), 27:17
debugging, 25:223
discipline and, 27:1
fault generation model and mental stress effect analysis, 26:31
fourth-generation language system for, 25:193
information-hiding metric, 26:211
load-building algorithm for parallel compilation of files in software application, 26:167
model-based framework for integration of software metrics, 26:77
modeling concurrent programs with colored Petri nets, 26:129
object-oriented metrics, 26:87
program-merging system for evolution of software versions, 27:129
rapid prototyping, 24:3
robust regression for software estimation models, 27:3
role of professionals in small Italian software firms, 26:19
software process improvement methodology, transfer of, 26:61
state of the art and open issues in process-centered software engineering environments, 26:53
timing aspects of, 25:51
Software engineering
Alvey program and, 24:67
assessment of scholars and institutions, 27:63
comparing methods, 27:154
state of the art and open issues in process-centered, 26:53
Software estimation models, robust regression for, 27:3
Software failure, measuring risk, 25:257
Software life cycle, discipline and, 27:1
Software maintenance
discipline and creativity in, 26:195
information-hiding metric, 26:211
management practice and, 26:5
predicting, 24:223
program-merging system for evolution of software versions, 27:129
theory and practice, 25:125, 25:219
Software process language, concurrent software process language (CSPL), 27:17
Software production
management practice in European community, 26:5
management practice in Japan, 26:5
software process improvement methodology, transfer of, 26:61
Software project time/cost management model, β-Distributed stochastic petri net, 26:149
Software quality
Ada symbolic debugger, 26:69
decision making for software process improvement, 26:43
methods and tools for achieving, 26:1
model-based framework for integration of software metrics, 26:77
role of professionals in small

Italian software firms, 26:19
user satisfaction, 24:1
Software relationships, definition and management, 24:277
Software reliability
Ada symbolic debugger, 26:69
fault generation model and mental stress effect analysis, 26:31
Software reuse
artificial intelligence-based approach for, 27:207
Practitioner versus SoftClass, 25:147
Software science model, critique of, 26:197
Software technology, MYTHSEEKER project and computer system, 25:271
Software verification, in safety-critical software systems, 26:103
Software versions, program-merging system for, 27:129
Spreadsheet, application-specific interactive system based on, 25:201
Spreadsheet Calculator (CE) program, Equivalent C expressions (ECE) and, 25:185
Spreadsheet computing, very fast distributed, 25:185
SQL, versus object retrieval language (ORL), 24:187
Static integrity constraints, maintenance of, 27:171
Statistical inference method, fault location in real-time control systems, 25:3

T
Task elimination optimization technique, 27:233
Telephone switching system program, real-time, 24:223
Temporal data bases, storage organization for, 27:159
Temporal object data base, coherent architecture for, 27:195
Time basic net specifications, validation of timing requirements for, 27:97
Time precision trade-off, 27:73
Timing constraints, complex software system and, 25:23
Timing requirements, for time basic net specifications, 27:97
Timing specification, software development for reactive systems, 25:51
Traffic patterns, multistage packet-switched interconnection networks and unbalanced, 273
Transaction management, in object-oriented data base system, 24:115

U
Usability, customer responsibility for ensuring, 25:241
User interface development process, requirements on, 25:241
User interface management system, object-oriented data bases and, 27:183
User interfaces, theory and practice, 25:219
User satisfaction, software quality, 24:1
